

IMAGES™ ADDENDUM

Please read this addendum as it contains information not found in the manual. Some of these notes concern functions added to the program after the manual went to press and others are hints for easier use.

Lo-Res and Hi-Res - On your disk you will find two Images programs. The one named Images operates in the 320 X 200 resolution mode of the Amiga. This version uses a 32 color palette. There is also a version labeled Images-HIR which operates in the 640 X 200 resolution mode. Its color palette contains 16 colors. The manual describes the Lo-Res version, and except for the number of colors in the palette, both programs operate the same.

The manual describes making a working copy of your program on a separate disk. We recommend you copy Images Lo-Res and Images Hi-Res onto different disks as both programs are large. This will leave you more working space on each disk.

Swap Screens - In the Hi-Res version of Images the Swap Screens option is not available with less than 1 megabyte of Random Access Memory (RAM). Amigas with 512K are limited to one screen.

In the Manual - New functions were added to Images after the book went to press. They are described below.

Under - On the Effects requestor is a special effect called Under. There are three new buttons on the Under requestor.

Clear - This option turns off point Under for all colors.

Invert - The Invert option changes all the selections to their opposite. Turns everything on to off and vice versa.

Set - The Set function works the opposite of Clear. It turns all colors on.

Modify Colors - We have made a change to the color requestor as it is described in the manual. An additional button has been added which switches the method of modifying a color from HLS to RGB. It is located near the center of the requestor above the current color block. The HLS controls operate in the same manner as described in the manual. The RGB method allows you to adjust a color by varying the amount of Red, Green, and Blue. To swap from one method to another select the button.

Set Printer - Selecting Print from the Project menu will now give you two options. The first allows you to set the width and height of the area the painting will be printed in. This allows you to adjust the output for various effects and different printers. When selected it will display a requestor with two slider controls for making the adjustments. If you get distorted paintings from your printer try adjusting these numbers. The second option prints the current painting as described in the manual.
